| Team ID | |
| Project Name | Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau |
| Maximum Marks | 2 Marks |

**Proposed Solution :**

Project team shall fill the following information in the proposed solution template.

| S.No. | Parameter | Description |
|---|---|---|
| 1. | Problem Statement (Problem to be solved) | Data on UNESCO World Heritage Sites is scattered across spreadsheets and static reports, with no single interactive view showing site distribution, categories, regional trends, or which sites are currently in danger. This makes it hard for researchers, conservation bodies, and the public to quickly understand the state of global heritage. |
| 2. | Idea / Solution description | An interactive Tableau dashboard suite built from a cleaned UNESCO heritage sites dataset, covering 8 visualizations (category bar chart, region pie chart, world map of top sites, year-wise inscription forecast, country treemap, danger status pie chart, regional inscription trend lines, and a countries-per-region bubble chart), organized into two dashboards and a guided Story, and published via Tableau Public. The dashboards are further embedded into a custom Flask web application with navigation and a dark/light mode toggle, so anyone can explore the data without needing Tableau installed. |
| 3. | Novelty / Uniqueness | Combines site distribution, geographic, temporal, and risk/danger analysis in one connected suite rather than a single generic chart; pairs a Tableau Story with a custom-branded, publicly accessible Flask web page instead of only sharing a raw Tableau Public link; treemap and bubble views make the country/region-level scale easy to grasp at a glance. |

| | | |
|---|---|---|
| 4. | Social Impact / Customer Satisfaction | Helps conservation researchers and NGOs quickly identify at-risk heritage sites so preservation efforts can be prioritized; helps students, educators, and travelers learn about world heritage through an engaging visual experience rather than dense text reports; increases public awareness of endangered cultural and natural heritage. |
| 5. | Business Model (Revenue Model) | As an educational/research and awareness project, the primary value is knowledge-sharing rather than direct revenue. Potential extensions include offering the dashboard as a white-labeled reporting tool for heritage/tourism boards, or a freemium model where the public dashboard is free while custom regional reports or API data access are offered to conservation organizations for a fee. |
| 6. | Scalability of the Solution | Built on a layered architecture (data -> Tableau analytics -> Tableau Public -> Flask web app), so new years, regions, or additional UNESCO sites can be added to the dataset without redesigning existing charts. Additional scenario dashboards (e.g., climate-risk overlays, tourism impact) can be added as new worksheets and dropped into the existing dashboard/story structure with minimal rework. |
